

Care Access Navigator - Day 5(Week2, Day 1)

Project Workspace & Foundation Structure

HealthLine Regional Medical Center

Care Access Navigator – Week 2, Day 1: Project Workspace & Foundation Structure

IAM + GRC Healthcare Cybersecurity Capstone | Week 2: Foundation Infrastructure & IAM Lab | Status: In Progress — Planning to Implement

Organization	Environment	Today's Focus	Status
HealthLine Regional Medical Center (HRMC)	Simulated / Non-Production	Workspace, folders, naming, evidence, lab boundaries	Planned / To Be Implemented

1. Week 2, Day 1 Goal

Week 1 defined the HRMC scenario, its people, applications, requirements, and initial risk/control view — all on paper. Week 2 is where the project starts moving from paper to a working lab, and Day 1 is the planning step that comes right before that shift: deciding where every future file, screenshot, log, and ticket will live, before any of them actually exist.

This document lays out the plan to be implemented today, rather than a record of finished work. By the end of Day 1, the folder structure, naming rules, evidence locations, and lab boundaries described below should be physically created and ready to receive real content — but the Keycloak configuration itself is intentionally left for the next Day of Week 2, once this foundation is in place.

In plain terms: Everything in this document is written as "what will be set up" rather than "what has been finished." Treat the tables and folder trees below as the build plan for today's session, and check items off as they're actually created.

2. Project Workspace Overview

The project workspace will span three connected tools, matching the tech stack defined in the Project Design Documentation: a local/GitHub repository for versioned files, Monday.com for task and evidence tracking, and Google Drive/Docs for polished documentation. The plan is to mirror the same folder structure across the repository and Google Drive, so that a path like 06-evidence/01-screenshots/ means the exact same thing in both places and nobody has to remember two different layouts.

The reasoning behind a shared structure: over 12 weeks, dozens of files will accumulate — configs, diagrams, logs, tickets, risk items — and if the folder layout is inconsistent between tools, evidence becomes hard to locate right when it's needed most (during a review, an audit walkthrough, or the final demo). Deciding the structure once, on Day 1, is meant to prevent that.

2.1 Top-Level Folder Structure (To Be Created)

care-access-navigator/	
├── 01-docs/	(project & weekly baseline documentation)
├── 02-diagrams/	(Lucidchart exports: network, OSI, workflows)
├── 03-iam-lab/	(Keycloak realm exports, configs, scripts)
├── 04-applications/	(mock app configs / sample datasets)
├── 05-logs/	(authentication & access logs, SIEM exports)
├── 06-evidence/	(screenshots, tickets, approvals, test results)
├── 07-grc/	(risk register, control matrix, evidence index)
├── 08-reporting/	(Tableau workbooks, dashboard exports)
├── 09-portfolio/	(sanitized public-facing README + highlights)
├── 10-scripts/	(Python automation: data gen, log parsing)

Each of these ten folders is currently empty or only partially populated from Week 1; Day 1's task is to physically create any that don't yet exist, and move existing Week 1 files (baselines, network design, risk register) into their correct new location.

2.2 What Each Folder Will Hold, and Why

Folder	Will Hold	Why It's Separate
01-docs	Weekly baselines, the master design doc, glossary	Keeps written planning separate from technical artifacts
02-diagrams	Network topology, OSI mapping, workflow diagrams	Diagrams get updated on their own schedule, separate from prose docs
03-iam-lab	Keycloak realm/client exports, setup scripts	Isolates lab configuration so it can be restored or rebuilt independently
04-applications	Mock app configs and sample datasets	Separates simulated apps from the identity layer that controls them
05-logs	Raw authentication/access/SIEM log exports	Raw logs stay untouched here; summarized versions live in 07-grc
06-evidence	Screenshots, tickets, approvals, test results	Central home for anything that proves a control or workflow happened
07-grc	Risk register, control matrix, evidence index	Governance artifacts are reviewed on a different cadence than lab work
08-reporting	Tableau workbooks and dashboard exports	Keeps polished, presentation-facing outputs separate from raw data
09-portfolio	Sanitized, de-identified artifacts for public sharing	Physically separates anything safe to publish from anything that isn't
10-scripts	Python automation for data generation, log parsing	Keeps reusable code out of the documentation and evidence folders

3. Documentation Folders

Inside 01-docs/, the plan is to group weekly baseline files by week, so the project's history stays easy to navigate as it grows over the full 12 weeks rather than becoming one long unsorted list of files:

01-docs/		
├── week-01-planning/	(Day 1-3 baselines, risk register, control objectives)	
├── week-02-foundation-iam/	(this file, Keycloak setup docs – to be added)	
├── week-03-rbac/	(created when Week 3 begins)	
├── ...		
├── project-design-documentation.docx	(master source document)	
└── glossary.docx	(shared term definitions across all weeks)	

The week-02-foundation-iam/ folder will be created today and will initially hold only this Day 1 planning document; later Days this week (Keycloak realm setup, users/groups, logging foundation) will add their own files to the same folder as they're completed, so the whole week stays together.

The master Project Design Documentation and the glossary will stay at the top of 01-docs/ (not inside any week folder), since every week's work traces back to them and they shouldn't have to be duplicated or searched for inside a specific week's subfolder.

4. Repository & Naming Standards

Before files start accumulating, it's worth agreeing on names once rather than renaming things later. Consistent names make it possible to find, reference, or cite any file without opening it — which matters both for day-to-day work and for the Week 12 portfolio review, when a reader needs to trust that TCKT-0001 always means the same thing.

Item Type	Naming Pattern (Planned)	Example
Weekly baseline document	WeekX_DayY_ShortTitle.docx	Week2_Day1_Foundation_Structure.docx
Diagram export	WeekX_DiagramType_vN.png/.pdf	Week2_NetworkTopology_v1.pdf
Keycloak config export	iam-<realm-or-client>-<date>.json	iam-hrhc-realm-20260901.json
Screenshot evidence	EVID-WeekX-DayY-###_short-description.png	EVID-W2-D3-001_keycloak-role-created.png
Log export	LOG-<source>-<date>.csv/.json	LOG-authlogs-20260905.csv

Item Type	Naming Pattern (Planned)	Example
Ticket / access request	TCKT-####	TCKT-0001
Risk register item	R-##	R-01
Control objective	CO-##	CO-01
Functional / security requirement	FR-## / SR-##	FR-01, SR-01
Asset inventory item	AST-##	AST-01
Portfolio (sanitized) artifact	PORT-<topic>-<date>	PORT-rbac-matrix-20260910

4.1 Additional Conventions to Adopt

- GitHub branches: feature/weekX-short-description (e.g., feature/week2-keycloak-setup), merged into main once a week's deliverables are complete.
- Commit messages: Week X, Day Y: short summary of change, so the commit history reads like a project log.
- Monday.com items: mirror the same IDs used in files (e.g., a Monday task for TCKT-0001 uses that exact ID in its title), so the same identifier can be searched across tools.

IDs (R-##, CO-##, FR-##/SR-##, AST-##) are intended to never be reused once assigned, even if an item is later retired — retired items should be marked "Closed" rather than deleted, so historical references still resolve correctly.

5. Evidence Folders — Where Things Will Be Stored

Evidence is anything that will later prove a control, workflow, or configuration actually happened: a screenshot, a log excerpt, a ticket, or an approval. Rather than deciding this ad hoc later, the table below is meant to be the definitive, agreed-upon answer to "where does this go?" for the rest of the project — set once, on Day 1, before the first piece of real evidence is generated.

Artifact Type	Planned Storage Location	Naming Convention	When It Will Be Captured
Keycloak / app configurations	03-iam-lab/configs/	iam-<realm/client>-<date>.json	Exported after each meaningful configuration change, starting later this week
Screenshots	06-evidence/01-screenshots/	EVID-WeekX-DayY-###_desc.png	Captured at each significant lab step (e.g., role created, user provisioned)
Logs (auth, access, SIEM)	05-logs/	LOG-<source>-<date>.csv.json	Pulled whenever authentication/access activity needs to be reviewed or monitored
Tickets (access requests, incidents)	06-evidence/02-tickets/	TCKT-####	Logged whenever an access request or incident workflow begins, mirroring Monday.com
Approvals (manager/IAM sign-off)	06-evidence/03-approvals/	APPR-TCKT-####	Filed once a linked ticket is approved, one file per approval
Test/validation results	06-evidence/04-test-results/	TEST-<control-or-workflow>-<date>	Generated once control testing begins in later weeks
Sanitized portfolio artifacts	09-portfolio/	PORT-<topic>-<date>	Created near the end of each week, once raw evidence has been de-identified

5.1 Evidence Index (To Be Established)

A running evidence index (07-grc/evidence-index.xlsx) is planned to link every artifact above to the requirement, control, or risk it supports — for example, tying a future EVID-W2-D3-001 screenshot to CO-03 and SR-02. This index will start as an empty template with the right columns (Evidence ID, Description, Location, Linked Control/Risk, Date) and will gain a new row every time evidence is added, from this point through Week 12.

6. Lab Boundaries

Lab boundaries define what the simulated environment will be allowed to touch, and what it must never touch, once the IAM lab work begins — separate from, but built on top of, the simulated ePHI boundary already defined in Week 1, Day 1. These boundaries are meant to be agreed upon now, before Keycloak or any application is configured, so no later decision accidentally violates them.

Boundary Area	Planned Rule	Why It Matters
Data	Only synthetic identities, synthetic events, and fictional patient/workforce data will be used. No real patient data, real ePHI, or production data will enter the lab at any point.	Keeps the project legally and ethically safe to build and share
Network	The IAM lab (Keycloak) will run inside the isolated IAM VLAN (10.10.20.0/24) defined in the network design — not on a production network, and not exposed to the public internet.	Prevents the lab from being reachable outside the intended simulation
Identity provider	Keycloak will be configured as a standalone lab instance for this project only; it will not connect to any real organization's directory or authentication system.	Avoids accidentally touching a real identity system
Applications	The four HealthLine applications will remain lightweight/mock simulations or sample datasets, never real production software.	Matches the 12-week scope and avoids unnecessary build complexity
Access	Only the project owner (and, where relevant, an instructor/reviewer) will have access to the lab. No external or public accounts will be created.	Limits who can change or view lab configuration
Evidence handling	Any screenshot, log, or ticket that reveals synthetic patient-level detail will be handled per the Week 1 ePHI boundary rules before it is stored or shared.	Keeps evidence handling consistent with the Week 1 rules
Portfolio sharing	Only sanitized, de-identified artifacts from 09-portfolio/ will ever be shared publicly (e.g., GitHub, resume, interviews) — raw evidence in 06-evidence/ will stay private.	Protects anything not meant for a public audience

In plain terms: Lab boundaries are meant to answer "what will this environment be allowed to do," while the Week 1 ePHI boundary answers "which data inside it is sensitive." Setting both before any configuration work begins is intended to keep the whole project safely simulated end to end.

7. Deliverables & Definition of Done

The table below tracks what still needs to be physically created today. Each row should move from "Not Started" to "Done" as the folders, files, and documented rules are actually put in place.

Deliverable	Output To Create	Status	Will Be Done When...
Workspace structure	Top-level folder tree (01–10)	Not started	All 10 top-level folders exist in repo + Drive
Documentation folders	Weekly doc subfolder structure	Not started	Week 1 & Week 2 doc folders exist and Week 1 files are moved in
Naming standards	Naming pattern table (agreed)	Drafted (this doc)	Team/self has reviewed and adopted the pattern going forward
Evidence folders	Evidence storage table + index	Not started	Evidence subfolders exist; evidence-index.xlsx template created
Lab boundaries	Boundary rule table (agreed)	Drafted (this doc)	Rules are reviewed and will be followed once lab work starts

Estimated Week 2, Day 1 effort: ~1.5–2 hours to physically implement everything planned above. Once complete, this file should be updated (or a short completion note added) and saved in 01-docs/week-02-foundation-iam/.
