Automated Keycloak Leaver Deprovisioning	Implement automated deprovisioning between Microsoft Entra ID and Keycloak so that workforce termination triggers the timely disablement of corresponding Keycloak accounts, revocation of active sessions, and verification of application access removal. Implement reconciliation and alerting to detect accounts that remain enabled after termination. This planned control addresses the deprovisioning gap identified during Jeevan Smith's termination (TERM-2026-0301). Implementation and effectiveness testing are pending. Remediation Validation Plan – R02 Objective: Verify that terminating a workforce member in Microsoft Entra ID automatically revokes their Keycloak access and prevents access to the Mock EHR application. Test 1 – Account deprovisioning: Disable a synthetic employee account in Entra ID. Verify that the corresponding Keycloak account is automatically disabled within the organization's defined termination SLA. Test 2 – Session revocation: Confirm that active Keycloak sessions are terminated or invalidated and that the terminated employee cannot reuse an existing application session. Test 3 – Access verification: Attempt to authenticate and access the Mock EHR using the terminated test account. Verify that access is denied. Test 4 – Audit logging: Confirm that termination, account	Technical	akchrao@gmail.com	-	Care Access Navigator - IAM & GRC/ Healthcare IAM - Workforce Termination Risk Assessment - 1.0/Incomplete Leaver Deprovisioning Across Entra ID and Keycloak

	disablement, session revocation, and verification activities are logged with timestamps. Test 5 – Monitoring: Confirm that reconciliation or alerting identifies accounts that remain enabled after termination. Acceptance criteria: All five tests must pass, with supporting screenshots and log evidence. Any failure requires corrective action and retesting. Related finding: CAN-FIND-001 Related risk: R02 Status: Planned – Implementation and validation pending.
