GRC Dashboard Design

Week 11 · Care Access Navigator · HealthLine Regional Medical Center (HRMC)

KPIs, reporting design, wireframe, Tableau build steps and the values a correct dashboard must show

Author	Akhila Chennamaneni
Date	November 3, 2026
Version	v1.0
Audience	HRMC Security Officer and department managers (monthly); IAM and GRC analysts (weekly)
Data	08_Reporting/02_Dashboards/Tableau_Dataset/ (10 CSV files, refreshed 11/03 from live evidence by 10_Scripts/03_GRC_Build/build_tableau.py)
Tool	Tableau Public (free). Workbooks publish publicly, which is acceptable only because every row is synthetic.

Board items covered

Day	Board item	Where
Mon	Define dashboard KPIs and reporting design	Sections 1-2 (KPIs, wireframe)
Tue	Build IAM metrics dataset	access_review_AR-2026-Q4.csv, identity_detections.csv (live)
Wed	Build GRC and incident metrics dataset	controls, control_tests, audit_findings, exceptions, corrective_actions, risks, incidents, kpi_values
Thu	Build and validate integrated Tableau dashboard	Section 3 build steps; Section 4 validation values (built in the Tableau app)

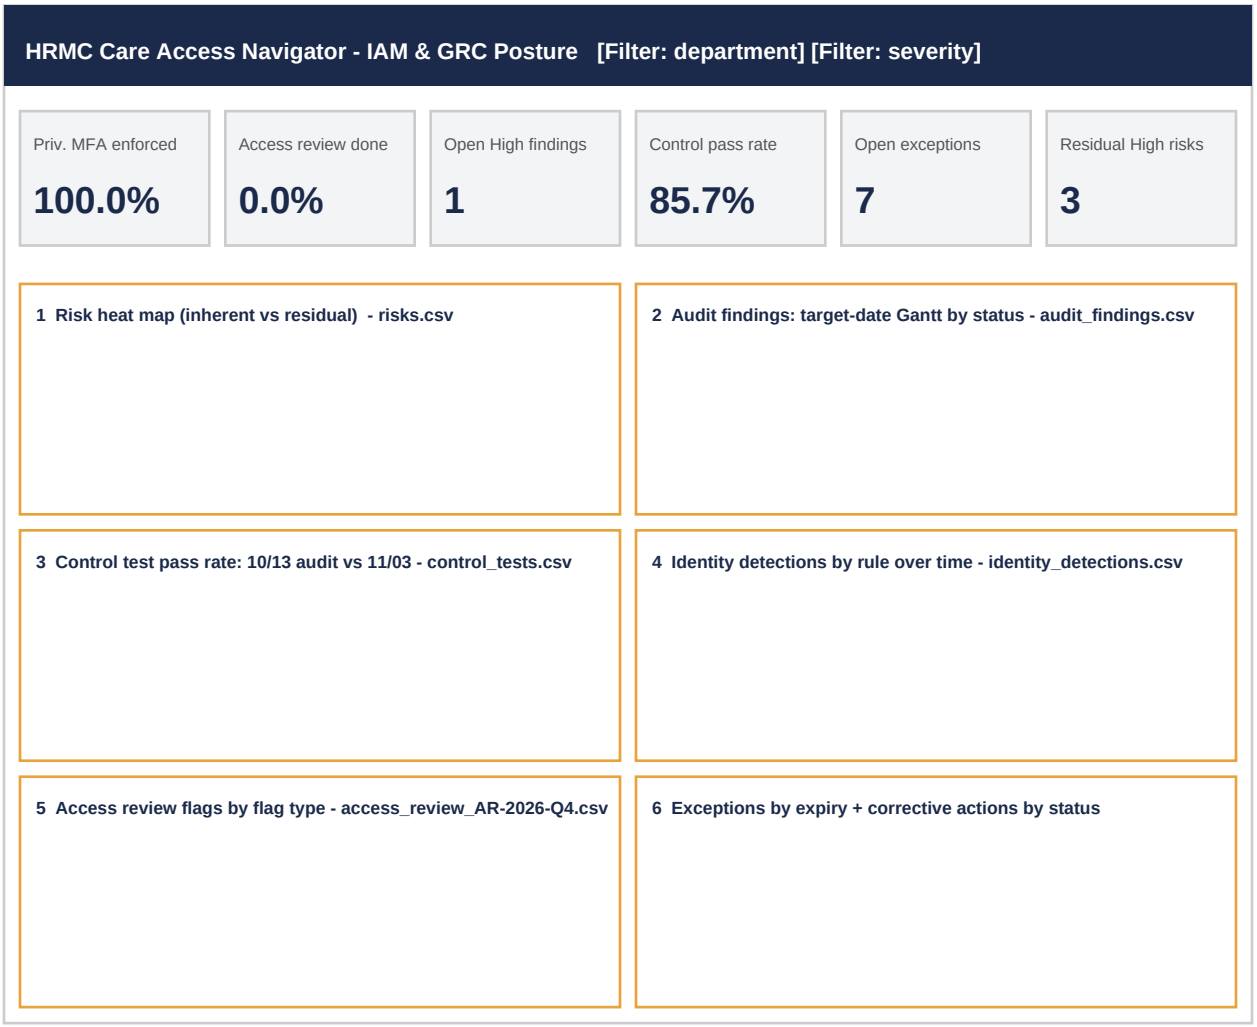
1. KPIs (measured 11/03/2026)

KPI	Formula	Value	Target	Note
Privileged MFA enforcement	privileged local accounts forced through OTP / privileged local accounts	**100.0%** (4/4)	100%	Policy enforced realm-wide by role mfa-required (EV-13)
Privileged MFA enrolment	privileged users with OTP enrolled / privileged users	**0.0%** (0/5)	100%	Enrolment happens at next sign-in (CA-13)
Access review completion	accounts with reviewer_decision / accounts	**0.0%** (0/16)	100% per quarter	Sign-off pending (CA-05)
Flagged accounts (High)	count risk=High	**5**	0	AR-2026-Q4
Open High audit findings	count rating=High and not closed	**1**	0 by Dec 2026	F-03 (EX-02)
Control test pass rate (11/03)	PASS / tests run on 2026-11-03	**85.7%** (12/14)	>= 90%	W5 retests + end-to-end run
Control test pass rate (10/13 audit)	PASS / tests in CAN-IA-2026-01	**57.1%** (8/14)	>= 90%	Baseline for the before/after story
Corrective actions verified	Verified actions / all actions	**47.1%** (8/17)	trend up	Exceptions and CA tracker
Open exceptions	exceptions not closed	**7**	each within expiry	Exception register
Residual High risks	count residual_rating=High	**3**	<= 1	risks.csv (scores from Risk Management 1)

Honest metrics: Red is shown on purpose. MFA enrolment and access-review completion are 0% because privileged users enrol at their next sign-in and the reviewer has not signed yet. The dashboard reports the real state, and the corrective-action tracker shows who closes each gap and by when.

2. Wireframe

One dashboard, 1200 x 900. KPI tiles across the top, six views below. Department and severity filters apply to the views that carry those fields.



- Colour: navy for neutral, green at or above target, amber within 10 points, red below (same thresholds as the Compliance 1 KPI monitor).
- Every tile links to its view (dashboard action), so a manager can go from a red number to the rows behind it.
- Tooltips show the evidence ID (EV-13, EV-14, EV-15) so each number can be traced.

3. Tableau build steps

Step	What to do
Connect	Tableau Public → Connect → Text file → open Tableau_Dataset/risks.csv; then add every other CSV from the same folder as its own data source (they are not joined).
Sheet 1 Risk heat map	risks.csv: Columns = inherent_likelihood, Rows = inherent_impact, Marks = Square, Colour = inherent_score, Label = risk_id. Duplicate it for residual_score.
Sheet 2 Findings Gantt	audit_findings.csv: Rows = finding_id, Columns = DAY(target_date), Marks = Gantt Bar, Colour = status, Label = rating.
Sheet 3 Control pass rate	control_tests.csv: Columns = audit_id, Rows = SUM([result]='PASS')/COUNT(result) as a calculated field 'Pass rate', Marks = Bar, Label = value.
Sheet 4 Detections	identity_detections.csv: Columns = DAY(time_utc), Rows = CNT(rule_id), Colour = rule_id, Filter = severity.
Sheet 5 Access review	access_review_AR-2026-Q4.csv: split flags with SPLIT or a custom split on ';' (Data pane → Transform → Custom Split), Rows = flag, Columns = CNT(username), Colour = risk.
Sheet 6 Remediation	corrective_actions.csv: Rows = status, Columns = CNT(action_id); exceptions.csv: Rows = exception_id, Columns = expires.
KPI tiles	kpi_values.csv: one Text sheet per KPI with a filter on kpi, showing value; colour by a calculated RAG field comparing value with target.
Dashboard	New Dashboard, size 1200 x 900, place tiles in a horizontal container, then the six sheets in a 2 x 3 grid; add filter actions from each tile.
Publish	File → Save to Tableau Public. Put the public link in 09_Portfolio and the README.

4. Validation: values the finished dashboard must show

Compare each view with these counts, computed from the same files. A mismatch means a filter, join or calculated field is wrong.

View	Expected
Risk heat map	5 risks; residual High = 3 (R01, R03, R04)
Findings	Closed (verified): 3; Open (exception): 2; In progress: 1
Control pass rate	CAN-IA-2026-01: 8/14; CAN-W5-RETEST-2026-11-03: 2/3; CAN-E2E-2026-11-03: 10/11
Detections	CAN-ID-001 brute force: 3; CAN-ID-002 disabled-account login: 2; CAN-ID-003 login while locked out: 3; CAN-ID-004 unauthorized app access: 15; CAN-ID-005 privilege change: 33
Access review	16 accounts; STALE_NO_LOGIN_90D: 7; PRIVILEGED_NO_MFA_ENROLLED: 5; NO_ROLE: 1; VENDOR_NO_END_DATE: 1
Remediation	Verified: 8; Open: 7; In progress: 2

Done when: Week 11 Thursday is complete when the published dashboard shows these values and a screenshot of it is saved as 06_Evidence/01_Screenshots/EV-16_Tableau_GRC_Dashboard_YYYYMMDD.png.
